No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

Novel polypeptides expressed in tumor cells useful for treating cancers have an ability to complex with a major histocompatibility complex molecule and comprises a specific unbroken amino acid sequence.

Claim 8; Page 36; 80pp; English.

The patent discloses MAGE-A10 and WAGE-A8 polypeptide, nonapeptide and decapeptide sequences, that function as tumour rejection antigens (TRAs). These peptides are capable of forming a complex with major histocompatibility complex (MHC) molecule type HLA-A2.1 (Human Leucocyte Antigen), that are recognised by T-lymphocytes and elicit an immune response from cyclytic T-lymphocytes (TL). They function as an immune response stimulator. Tumour rejection antigens are useful in prophylaxis, therapy and diagnosis of tumours and are effective in controlling or preventing tumour growth. The present peptide sequence is the human MAGE-A10 nonapeptide-1, that corresponds to residues 254-262 of the MAGE-A10 protein. This peptide can serve as a tumour rejection antigen (TRA) and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAB31302-59 represent exemplary antigens which are characteristic of tumours. They can be used to enhance the immune response of vaccines comprising peptides drived from human MAGE-A1 HLA (human leukocyte antigen) class II-bindring protein. Peptides derived from the MAGE-A1 HLA bindring protein stimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-A1 HLA bindring protein is useful as a disapnestic agent for diagnosing a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, osteosarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA bindring protein are useful in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and
in combination with adjuvants, can produce vaccines useful for treating a variety of tumours that express MAGE-Al0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel MACE-A1 human leukocyte antigen class II peptides which bind to are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.
                                                                                                                                                                                                                                                          Exemplary antigen characteristic of tumours and derived from MAGE-AlO.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for the preparation of readyfor-use, cryopreserved, mature dendritic cells comprising growing mature dendritic cells in a culture medium that includes a 'maturation cockeail' of one or more maturation stimuli and freezing the resulting matured cells in a freezing medium that does not contain heterologous everum. When loaded with antigens, the dendritic cells can be used as vaccines, e.g. against tumours and hepatitis B virus. The present sequence is an antigen described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparation of cryopreserved, mature dendritic cells, useful in vaccines, comprises culturing immature cells on medium containing cocktail of

                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                         The invention relates to a novel method for identifying peptides originating from a particular cell type, which are capable of binding to major histocompatibility complex (MHC) molecules of a particular haplotype. The method comprises analysing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype. The method is useful for identifying peptides for treating an autoimmune disease, such as T or B cell and/or allergic disease or condition, rheumatoid arthritis, or multiple sclerosis, neurodegenerative disorders, e.g. Alzheimer's disease, or diseases associated with inflammation. The sequences of the invention may be used in a gene therapy application. This sequence represents a peptide relating to the method for identifying MHC binding peptides of the invention
                                                                                                                                                                 Identifying peptides that are capable of binding to major histocompatibility complex (WHC) molecules of a particular haplotype by analyzing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a peptide which binds HLA (human leucocyte antigen) B18 to form T-cell epicope. The invention is useful for treating a pathological conditions such as melanoma, lung cancer and head and neck cancer. The present sequence is human HLA-B18 binding MAGE-
Identifying a cell that differentiates into a metastatic cancer cell, useful for preventing metastatic cancer, comprises identifying a mutated fibronectin in the cell.
                                                                                                                                                                                                   The invention comprises a method for identifying a cell that will differentiate into a metastatic cancer cell, the method involves identifying a mutated fibronectin in the cell. The method of the invention is useful for preventing metastatic cancer. The present amino acid sequence represents a Class I HLA-restricted testis cancer antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HLA; human leucocyte antigen; melanoma; lung cancer; head cancer;
neck cancer; MAGE-3; human.

The present invention relates to an isolated peptide which binds to a major histocompatibility complex (MHC) molecule to form a complex that is recognized by a cytolytic T-cell which recognizes and lyses cells presenting complexes of HLA-A2 molecules comprising a sequence of 9 amino acids fully defined in the specification, with the proviso that the peptide is not the peptide of S17 itself. Specifically claimed is an HLA-binding peptide comprising a sequence of 9 amino acids fully defined in the specification. The composition and methods are useful for diagnosing or treating cancer, particularly melanoma. The present sequence
                                                                                                                                                                                                                                                                                                                                                          New isolated SSX-2 and SSX-2-related peptides that bind to human leukocyte antigen (HLA) molecules, useful for diagnosing or treating cancer, particularly melanoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to peptides which form immunologically active complexes with MHC molecules. The invention is useful for treating as abject with pathological condition such as cancer which is melanoma by presenting HLA-CW6 molecules on the cell surface. The present sequence is human HLA-CW6 binding MAGE-1 peptide.

antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                 MAGE-A10; human; Tumour Rejection Antigen; TRA; Human Leucocyte Antigen; HLA; Major Histocompatibility Complex; MHC; cytolytic T-lymphocyte; CTL; immune response stimulator; prophylaxis; therapy; diagnosis; tumour; cancer; TWF; tumour necrosis factor; vaccine; cytostatic.

                                                                                    The patent discloses MAGE-A10 and MAGE-A8 polypeptide, nonapeptide and decapeptide sequences, that function as tumour rejection antigens (TRA8). These peptides are capable of forming a complex with major histocompatibility complex (MIG) molecule type HLA-A2.1 (Human Leucocyte Antigen), that are recognised by T-lymphocytes and elicit an immune response from cytolytic T-lymphocytes (CTL). They function as an immune response stimulator. Tumour rejection antigens are useful in prophylaxis, therapy and diagnosis of tumours and are effective in controlling or preventing tumour growth. The present peptide sequence is the human MAGE-A10 decapeptide. I, that corresponds to residues 254-253 of the MAGE-A10 protein. This peptide can serve as a tumour rejection antigen (TRA) and in combination with adjuvants, can produce vaccines useful for treating a variety of tumours that express MAGE-A10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Similarity 100.0%; Score 51; DB 3; Length 10; Similarity 100.0%; Pred. The patent discloses MAGE-A10 and MAGE-A8 polypeptide, nonapeptide and decapeptide sequences, that function as tumour rejection antigens (TRAs).
These peptides are capable of forming a complex with major histocompatibility complex (MHC) molecule type HLA-A2.1 (Human Leuccoyte histocompatibility complex (MHC) molecule type HLA-A2.1 (Human Leuccoyte Antigen), that are recognised by T-lymphocytes and elicit an immune response from cytolytic T-lymphocytes (CTL). They function as an immune response from cytolytic T-lymphocytes (CTL). They function as an immune response stimulator. Tumour rejection antigens are useful in prophylaxis, therapy and diagnosis of tumours and are effective in controlling or protein, comprising nonapeptides and decapeptides, that serve as tumour rejection antigens (TRAs). The novel TRAs encoded by MAGE-A10 is identified using melanoma call line (LB1751-WEL), stimulated by autologous CTL clone (447A/5) to produce TNF (tumour necrosis factor).
Expression of MAGE-A10 has been detected in a variety of tumours like melanomas, carcinomas of the head and neck, bladder and prostate,
                                                                                                                  MAGE-Al0; human; Tumour Rejection Antigen; TRA; Human Leucocyte Antigen; HLA; Major Histocompatibility Complex; MHC; cytolytic T-lymphocyte; CTL; immune response stimulator; prophylaxis; therapy; diagnosis; tumour; cancer; TNF; tumour necrosis factor; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   myelomas and lung cancer. The only normal tissue expressing MAGE-Al0 is the testis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polypeptides expressed in tumor cells useful for treating car have an ability to complex with a major histocompatibility complex molecule and comprises a specific unbroken amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 51; DB 3; Length 369; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel hybrid antigen which comprises at least one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein. The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                        hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; antimicrobial; cytostatic; vaccine; gene therapy; infectious disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fletchner J, Prince-Cohane K, Mehta S, Slusarewicz P, Andjelic S;

```
The present invention relates to human secreted prostate cancer antigen coding sequences (AAF1274-AAF72789) and proteins (AAB80273-AAB80221).
The coding sequences and proteins of the present invention are useful for preventing, treating or ameliorating a medical condition; and for the diagnosis and treatment of diseases and disorders. Diseases and disorders can be diagnosed and treated include (auto)immune diseases (e.g. graft versus host disease and rheumacoid arthritis), inflammatory and allergic disorders (e.g. asthma), hyperproliferative disorders (e.g. cancers and laukemias), cardiovascular disorders (e.g. stroke), arterial occlusive disorders (e.g. arteriosclerosis), anglogenesis related disorders (e.g. crinopathy and keloid scars), ocular disorders (e.g. glacoma), neurological disorders (e.g. Alzheimer's, Parkinson's disease, epilepsy and Creutzfeld-Jakob disease) and infections caused by bacteria, fungi, viruses or parasites. They may also be useful for wound healing, epithelial cell proliferation, supporting cell cuture, tissue regeneration, birth control and as a food additive or preservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid molecule encoding human secreted prostate cancer antigens, useful for the diagnosis and treatment of disorders such as cancer, leukemia and autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a blological sample from the patient with a polynucleotide that eslectively hybridises to a sequence that is 80 % identical to a cadence the human bladder cancer-associated proteins given in ABR4814 to AC51059 concert the human bladder cancer-associated proteins given in ABR4814 to ABR48242). Bladder cancer-associated proteins given in ABR4814 to ABR48242). In a call in vaccine production. The method can be used in antisense gene therapy and can very concer-associated transcript in a cell from a patient. The method is caseful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnosic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

"Genome sequence of Vibrio parahaemolyticus: a pathogenic mechanism
distinct from that of V. cholerae.";

Lancet 361:743-749(2003).

--- FUNCTION: Sigma factors are initiation factors that promote the
attachment of RNA polymerase to specific initiation sites and are
then released. This alternative sigma factor is specific for the
flagellin gene (filc) expression.

--- INDUCTION: Under conditions in which the polar flagellum is not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           55 68 Polymerase core binding (Potential).

238 Pyridoxal phosphate (By similarity).
                                                                                                                                                                                                                      Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- COFACTOR: Pyridoxal phosphate (By similarity).
-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELLIVIAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the class-I pyridoxal-phosphate-dependent aminotransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tabata 8.;
"Sequence analysis of the genome of the unicellular cyanobacterium Symechocystis sp. strain PCC6803. II. Sequence determination of the entire genome and assignment of potential protein-coding regions."; DNA Res. 3:109-136(1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                        Sequence 72, Application US/08178570

Patent No. 552167

GENERAL INFORMATION:
APPLICANT: Lewis C. Cantley
APPLICANT: Shou Song yang
TITLE OF INVENTION: Substrate Specificity of Protein Kinases
NUMBER OF SEQUENCES: 77

CORRESPONDENCE ADDRESS:
                                                                                                                                                                   Length 8;
                                                                                                                                                                                                      1; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               47.1%; Score 24; DB 1; Length 9; 42.9%; Pred. Sequence 45, Application US/08369643A

Patent No. 6004757
GENERAL INFORMATION:
APPLICANT: Cantley, Lewis C.
APPLICANT: Songwang, Zhou
TITLE OF INVENTION: Substrate Specificity of Protein Kinases
FILE REFERENCE: CNS-001CP
CURRENT APPLICATION NUMBER: US/08/369,643A
CURRENT APPLICATION NUMBER: US 08/178,570
EARLIER APPLICATION NUMBER: US 08/178,570

SALIER FILING DATE: 1994-01-07

                                                                                                                                                     HEBUL:

US-09-116-766-22

Sequence 22, Application US/09116766

Patent No. 596898

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Burstein, Yigal

APPLICANT: Trainin, Nathan

APPLICANT: Rycus, Avigail

TITLE OF INVENTION: THF-gamma2 Analogs and Pharmaceutical

TITLE OF INVENTION: Compositions Comprising Them
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               49.0%; Score 25; DB 2; Length 8; 62.5%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 2000-412317/35.

Novel polypeptides expressed in tumor cells useful for treating cancers have an ability to complex with a major histocompatibility complex molecule and comprises a specific unbroken amino acid sequence.

Claim 8; Page 36; 80pp; English.

The patent discloses MAGE-A10 and MAGE-A8 polypeptide, nonapeptide and decapeptide sequences, that function as tumour rejection antigens (TRAS). These peptides are capable of forming a complex with major histocompatibility complex (WHC) molecule type HLA-A2.1 (Human Leucocyte Antigen), that are recognised by T-lymphocytes and elicit an immune response from cytolytic T-lymphocytes (TL). They function as an immune response stimulator. Tumour rejection antigens are useful in prophylaxis, therapy and diagnosis of tumours and are effective in controlling or preventing tumour growth. The present peptide sequence is the human MAGE-A10 nonapeptide-1, that corresponds to residues 254-262 of the MAGE-A10 protein. This peptide can serve as a tumour rejection antigen (TRA) and

œ.

```
Preparation of cryopreserved, mature dendritic cells, useful in vaccines, comprises culturing immature cells on medium containing cocktail of maturation factors, then freezing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB31302-59 represent exemplary antigens which are characteristic of tumours. They can be used to enhance the immune response of vaccines comprising peptides derived from human MAGE-A1 HIA (human leukocyte antigen) class II-binding protein. Human leukocyte antigen) class II-binding protein specification of CD4+T lymphocytes. The MAGE-A1 HIA binding protein stimulate the activity and proliferation of CD4+T lymphocytes. The MAGE-A1 HIA binding protein is useful as a disagnestic agent for diagnosing a disorder characterized by expression of MAGE-A1.

The protein is used for treating a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, osteosarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HIA binding protein are useful in the production
in combination with adjuvants, can produce vaccines useful for treating a variety of tumours that express MAGE-Al0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel MAGE-A1 human leukocyte antigen class II peptides which bind to and are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.
                                                                                                                                                                                                                                                                                                        Exemplary antigen characteristic of tumours and derived from MAGE-A10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to a method for the preparation of readyfor-use, cryopreserved, mature dendritic cells comprising growing immature dendritic cells in a culture medium that includes a 'maturation cockeail' of one or more maturation etimuli and freezing the resulting matured cells in a freezing medium that does not contain heterologous serum. When loaded with antigens, the dendritic cells can be used as vaccines, e.g. against tumours and hepatitis B virus. The present sequence is an antigen described in the invention
                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                       ö

Identifying a cell that differentiates into a metastatic cancer cell, useful for preventing metastatic cancer, comprises identifying a mutated fibronectin in the cell.
                                                                                          The invention comprises a method for identifying a cell that will differentiate into a metastatic cancer cell, the method involves identifying a mutated fibronectin in the cell. The method of the invention is useful for preventing metastatic cancer. The present amino acid sequence represents a Class I HLA-restricted testis cancer antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                    The invention relates to a novel method for identifying peptides originating from a particular cell type, which are capable of binding to major histocompartibility complex (MRC) molecules of a particular haplotype. The method comprises analysing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype. The method is useful for identifying peptides for treating an autoimmune disease, such as T or B cell and/or allergic disease or condition, rheumatoid arthritis, or multiple sclerosis, neurodegenerative disorders, e.g. Alzheimer's disease, or diseases associated with inflammation. The sequences of the invention may be used in a gene therapy application. This sequence represents a peptide relating to the method for identifying MHC binding peptides of the invention
                                                                                                                                                                                  Identifying peptides that are capable of binding to major histocompatibility complex (MHG) molecules of a particular haplotype by analyzing peptides bound to the soluble and secreted form of the MHG molecules of the particular haplotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a peptide which binds HLA (human leucocyte antigen)-Bl8 to form T-cell epitope. The invention is useful for treating a pathological conditions such as melanoma, lung cancer and head and neck cancer. The present sequence is human HLA-Bl8 binding MAGE-

The present invention relates to an isolated peptide which binds to a major histocompatibility complex (MHC) molecule to form a complex that is recognized by a cytolytic T-cell which recognizes and lyses cells presenting complexes of HLA-A2 molecules comprising a sequence of 9 amino acids fully defined in the specification, with the proviso that the peptide is not the peptide of S17 itself. Specifically claimed is an HLA-binding peptide comprising a sequence of 9 amino acids fully defined in the specification. The composition and methods are useful for diagnosing or treating cancer, particularly melanoma. The present sequence
                                                                                                                                                                                                                                                                                                                                                              New isolated SSX-2 and SSX-2-related peptides that bind to human leukocyte antigen (HLA) molecules, useful for diagnosing or treating cancer, particularly melanoma.
                     major histocompatibility complex; MHC; cytolytic T-cell; HLA-A2; Cytostatic; cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating subject with pathological condition having human leukocyte antigen-Cw6 molecules presented on cell surface by administering peptides to subject for generating immunologically active response against cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to peptides which form immunologically active complexes with MHC molecules. The invention is useful for treating a subject with pathological condition such as cancer which is melanoma by presenting HLA-CW6 molecules on the cell surface. The present sequence is human HLA-CW6 binding MAGE-1 peptide.

The patent discloses MAGE-A10 and MAGE-A8 polypeptide, nonapeptide and decapeptide sequences, that function as tumour rejection antigens (TRAs). These peptides are capable of forming a complex with major histocompatibility complex (MHC) molecule type HLA-A2.1 (Human Leucocyte Antigen), that are recognised by T-lymphocytes and elicit an immune response from cytolytic T-lymphocytes (CTL). They function as an immune response stimulator. Tumour rejection antigens are useful in prophylaxis, therapy and diagnosis of tumours and are effective in controlling or preventing tumour growth. The present peptide sequence is the human MAGE-A8 nonapeptide-1, that corresponds to residues 232.240 of the MAGE-A8
antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MAGE-A8; human; Tumour Rejection Antigen; TRA; Human Leucocyte Antigen; Histocompatibility Complex; MHC; cytolytic T-lymphocyte; CTL; immune response stimulator; prophylaxis; therapy; diagnosis; tumour; cancer; TNF; tumour necrosis factor; vaccine; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein. This peptide can serve as a tumour rejection antigen (TRA) and in combination with adjuvants, can produce vaccines useful for treating variety of tumours that express MAGE-A8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel polypeptides expressed in tumor cells useful for treating car have an ability to complex with a major histocompatibility complex molecule and comprises a specific unbroken amino acid sequence.

                                                                                                                                                                                                                                                       response against a tumour cell, comprising administering to a subject with a tumour an amount of IFN-beta receptor agonist and tumour sasociated antigen (TAA). The method is useful for increasing an immune response against a tumour cell. The present sequence is a peptide used in the exemplification of the invention.

The invention relates to a composition (I) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (I) a vaccine comprising (I). CPP associated with an antigen for a disease, by providing (I) and (2) associated with an antigen for disease, by providing (I) and CPP associated with an antigen for disease, by providing (I) and CPP associated with an antigen for disease, by providing the antigens are, for example, tumour antigen derived epitopes recognised by tumour infiltrating lymphocytes (TIL) of HLA (human leukocyte antigen) class I or II. The composition is useful for enhancing immunity in an animal to a disease, by administering a mature dendritic cell comprising CPP associated with an antigen to disease, to the animal, such that following the aministration, animal is protected from disease, where the animal comprises both CD4+ and CD8+ T cells. It is also useful for treating a disease (e.g. cancer, tumour, melanoma, lukmena, lymphoma, sarcoma, lung cancer, non-Hodgin's lymphoma, leukaemia, Hodgin's lymphoma, uterine cancer, cervical cancer, breather animal is further subjected to a cancer and pancearic cancer.

The annimal is further subjected to accer and pancearic cancer.

Sequence 6 AA

radiation, chemotherapy or gene therapy. The administration of (1), preferably dendritic cell is prior to, subsequent to or concurrent with, the cancer treatment. The present sequence is a tumour antigen derived epitope for inclusion in the composition of the invention

AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukcoyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytocoxic T lymphocytes (CLE) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the inteat foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AlDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce TLE ex vivo for infusion back into a produce T cell seponse, by contacting a cytotoxic T cell with the peptide.

AAV45390 to AAV48214 represent specifically claimed immunogenic peptides having a human major histocomparibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytocoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are cancers in mammals (especially to treat or prevent viral infections and cancers in mammals (especially when a pentile sections and cancers in mammals (especially when a definistered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of viral infection or caneer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases.
                                                                                                                                                                                                                                                    Immunogenic peptide having a human leukocyte antigen binding motif #701.

AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen from of a peptide fragment bound to a HLA molecule, rather antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen from in fraction in factions. The peptides are cumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cenal carcinoma. They can be administered as vaccines to and c. AlDS, and renal antidividuals succeptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also patient. The polynucleotides encoding the immunogenic peptides are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases.
                                                                                                                           Immunogenic peptide having a human leukocyte antigen binding motif #1100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (alpha, beta and gamma), linked to each other by disulfide bonds.

-1- FTM: Conversion of fibringen to fibrin is triggered by thrombin, which cleaves fibrinoperides A and B from alpha and beta chains and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot.

-i-PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,
